Q6(iii) If T moves on $xy = c^2$.

$$\text{then } x_0 y_0 = c^2.$$

$$\text{For } R \quad x = \frac{1}{y_0}, \quad y = \frac{1}{x_0}.$$

$x y = \frac{1}{x_0 y_0} = \frac{1}{c^2}$.
 $\therefore R$ moves on $xy = \frac{1}{c^2}$ which
is a hyperbola.

$$27 \tan(\alpha + \frac{\pi}{2}) \\ = -\tan(\pi - (\alpha + \frac{\pi}{2})) \\ = -\tan(\frac{\pi}{2} - \alpha) = -\cot \alpha. \quad \text{(i)}$$

$$\text{(ii)} \quad \tan[(2n+1)\frac{\pi}{4}] = (-1)^n.$$

$$\text{For } n=1, \text{ RHS} = (-1)^1 = -1 = \text{LHS}. \\ \text{True for } n=1.$$

Assume true for $n=k$.
 $\tan[(2k+1)\frac{\pi}{4}] = (-1)^k$.

$$\text{For } n=k+1, \text{ need to prove} \\ \tan[(2k+3)\frac{\pi}{4}] = (-1)^{k+1}$$

$$\text{H.S.} = \tan[(2k+3)\frac{\pi}{4}]$$

$$= \tan[(2k+1)\frac{\pi}{4} + \frac{\pi}{2}]$$

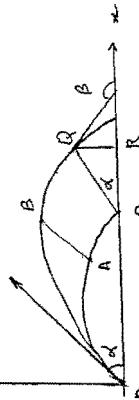

$$= -\cot[(2k+1)\frac{\pi}{4}] \quad \text{(i)}$$

$$= -\frac{1}{\tan[(2k+1)\frac{\pi}{4}]} = (-1)^{k+1} \quad \text{(ii)}$$

True for $n=k+1$ if true for $n=k$.

\therefore True for $n=1$, hence true for
 $n=2, 3, 4, \dots$.
 \therefore True for $n \geq 1$.

(b) (i)

$$\text{For the slower stone} \\ y_1 = -g \\ y_1 = Ut \cos \alpha \\ y_1 = -\frac{1}{2}gt^2 + Ut \sin \alpha \\ \text{Similarly for the faster stone} \\ y_2 = -\frac{1}{2}gt^2 + Ut \sin \alpha, \quad x_2 = Ut \cos \alpha. \quad \text{(i)}$$

At time t , let the stones be at $A \neq B$.

$$m_{AB} = \frac{y_2 - y_1}{x_2 - x_1}, \quad \text{(i)} \\ = \frac{-\frac{1}{2}gt^2 + Ut \sin \alpha - (-\frac{1}{2}gt^2 + Ut \sin \alpha)}{Ut \cos \alpha - Ut \cos \alpha} \\ = \frac{0}{Ut \cos \alpha} = \tan \alpha. \quad \text{(ii)}$$

(iii) When the faster stone is at Q , the top of the wall, the slower stone is at P .

$$\tan \alpha = \frac{V-U}{U-U} = \tan \alpha. \quad \text{(i)}$$

(iv) When the faster stone is at Q , the top of the wall, the slower stone is at P .

$$\tan \alpha = \frac{V-U}{U-U} = \cot \alpha. \quad \text{(ii)}$$

(v) When $y_1 = 0$.

$$gt^2 + Ut \sin \alpha = 0, \\ gt^2 = -2ut \sin \alpha \quad (t \neq 0), \\ t = \frac{2u \sin \alpha}{g}.$$

At this instant, the faster stone is at Q .

(b) (ii) $P=z, \quad S=1, \quad S'=-1.$

$$PS = |z-1|, \quad PS' = |z+1|$$

If $|z-1| + |z+1| = 4$, then
 $PS + PS' = 4$.

The locus of P is therefore an ellipse with foci S, S' and
major axis 4 units.
i.e. $a=2$,

$$ae = 1 \quad \therefore e = \frac{1}{2},$$

$$b^2 = a^2(1-e^2) = 3$$

\therefore Cartesian eqn of P is
 $\frac{x^2}{4} + \frac{y^2}{3} = 1$.

$$\tan(\pi - \beta) = \frac{y}{x} \quad \text{(b)} \\ \therefore \tan \beta = -\frac{y}{x} \\ \tan \beta = -\frac{(-gt + Vs \sin \alpha)}{Vs \cos \alpha} \\ = \frac{\beta(\frac{2u \sin \alpha}{g}) - Vs \sin \alpha}{Vs \cos \alpha} \\ = \frac{\sin \alpha(2u - V)}{Vs \cos \alpha} = \frac{\tan \alpha(2u - V)}{V} \quad \text{(i)}$$

Q8(b)(iii) cont.

$$x = -k[V - kg \ln(kg + v)] + k[kh - kg - kg \ln(kh)] \\ = k[kh - kg - v + kg \ln(\frac{kg+v}{kh})]$$

At $v=H$ $v=0$.

$$H = k[kh - kg + kg \ln(\frac{H}{kh})] \quad \text{(i)}$$

$$(c) (i) \quad P(x) = (x^2 - a^2)Q(x) + px + q.$$

$$P(x) = px + q \quad \text{(ii)}$$

$$P(-x) = -px + q \quad \text{(iii)}$$

(d) (i)

$$P(x) - P(-x) = 2px.$$

$$\therefore p = \frac{1}{2x} [P(x) - P(-x)] \quad \text{(i)}$$

(d) (ii)

$$P(x) + P(-x) = 2q$$

(d) (iii)

$$q = \frac{1}{2} [P(x) + P(-x)] \quad \text{(i)}$$

(d) (iv)

$$(f) \quad x^n - a^n = (x^2 - a^2)Q(x) + px + q$$

$$P(x) = \# x^n - a^n$$

When n is even $P(a) = 0$

$$P(-a) = 0.$$

$\therefore q = 0, p = 0$.

\therefore no remainder.

When n is odd

$$P(a) = 0, \quad P(-a) = -2a^n. \quad \text{(i)}$$

$$px + q = \frac{1}{2a} [2a^n] x + \frac{1}{2}(0 - 2a^n)$$

$$= a^{n-1}x - a^n. \quad \text{(i)}$$

(b) (iii)

(b) (iv) If T moves on $xy = c^2$.

The locus of P is therefore an ellipse with foci S, S' and
major axis 4 units.

$$i.e. a=2,$$

$$ae = 1 \quad i.e. e = \frac{1}{2}.$$

$$b^2 = a^2(1-e^2) = 3$$

\therefore Cartesian eqn of P is

$$\frac{x^2}{4} + \frac{y^2}{3} = 1$$
