

# *Permutations*

## **Case 4: Ordered Sets of $n$ Objects, Arranged in a Circle**

What is the difference between placing objects in a line and placing objects in a circle?

The difference is the number of ways the first object can be placed.

Line

In a line there is a definite start and finish of the line.

The first object has a choice of 6 positions

Circle

In a circle there is no definite start or finish of the circle.

It is not until the first object chooses its position that positions are defined.

## Line

possibilities for object 1      possibilities for object 2      possibilities for object 3      possibilities for last object

Number of Arrangements =  $n \times (n-1) \times (n-2) \times \dots \times 1$

## Circle

possibilities for object 1      possibilities for object 2      possibilities for object 3      possibilities for last object

Number of Arrangements =  $1 \times (n-1) \times (n-2) \times \dots \times 1$

$$\begin{aligned} \text{Number of Arrangements in a circle} &= \frac{n!}{n} \\ &= (n-1)! \end{aligned}$$

e.g. A meeting room contains a round table surrounded by ten chairs.

(i) A committee of ten people includes three teenagers. How many arrangements are there in which all three sit together?

the number of ways the  
three teenagers can be

arranged

$$\begin{aligned} \text{Arrangements} &= 3! \times 7! \\ &= \underline{30240} \end{aligned}$$

number of ways of arranging  
8 objects in a circle  
(3 teenagers) + 7 others

(ii) Elections are held for Chairperson and Secretary.

What is the probability that they are seated directly opposite each other?

Ways (no restrictions) = 9!

President can sit anywhere as they are 1st in the circle

Secretary must sit opposite

President

Ways remaining people can go

Ways (restrictions) =  $1 \times 1 \times 8!$

$$P(\text{P \& S opposite}) = \frac{1 \times 1 \times 8!}{9!}$$
$$= \frac{1}{9}$$

*Note: of 9 seats only 1 is opposite the President*  
 $\therefore P(\text{opposite}) = \frac{1}{9}$   
*Sometimes simple logic is quicker!!!!*

## 2002 Extension 1 HSC Q3a)

Seven people are to be seated at a round table

(i) How many seating arrangements are possible?

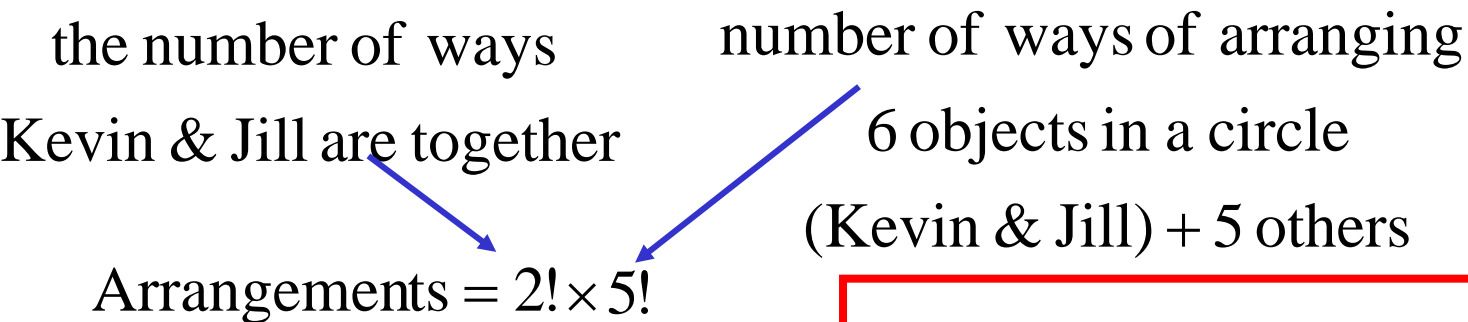

$$\begin{aligned}\text{Arrangements} &= 6! \\ &= \underline{720}\end{aligned}$$

(ii) Two people, Kevin and Jill, refuse to sit next to each other. How many seating arrangements are then possible?

*Note: it is easier to work out the number of ways Kevin and Jill are together and subtract from total number of arrangements.*

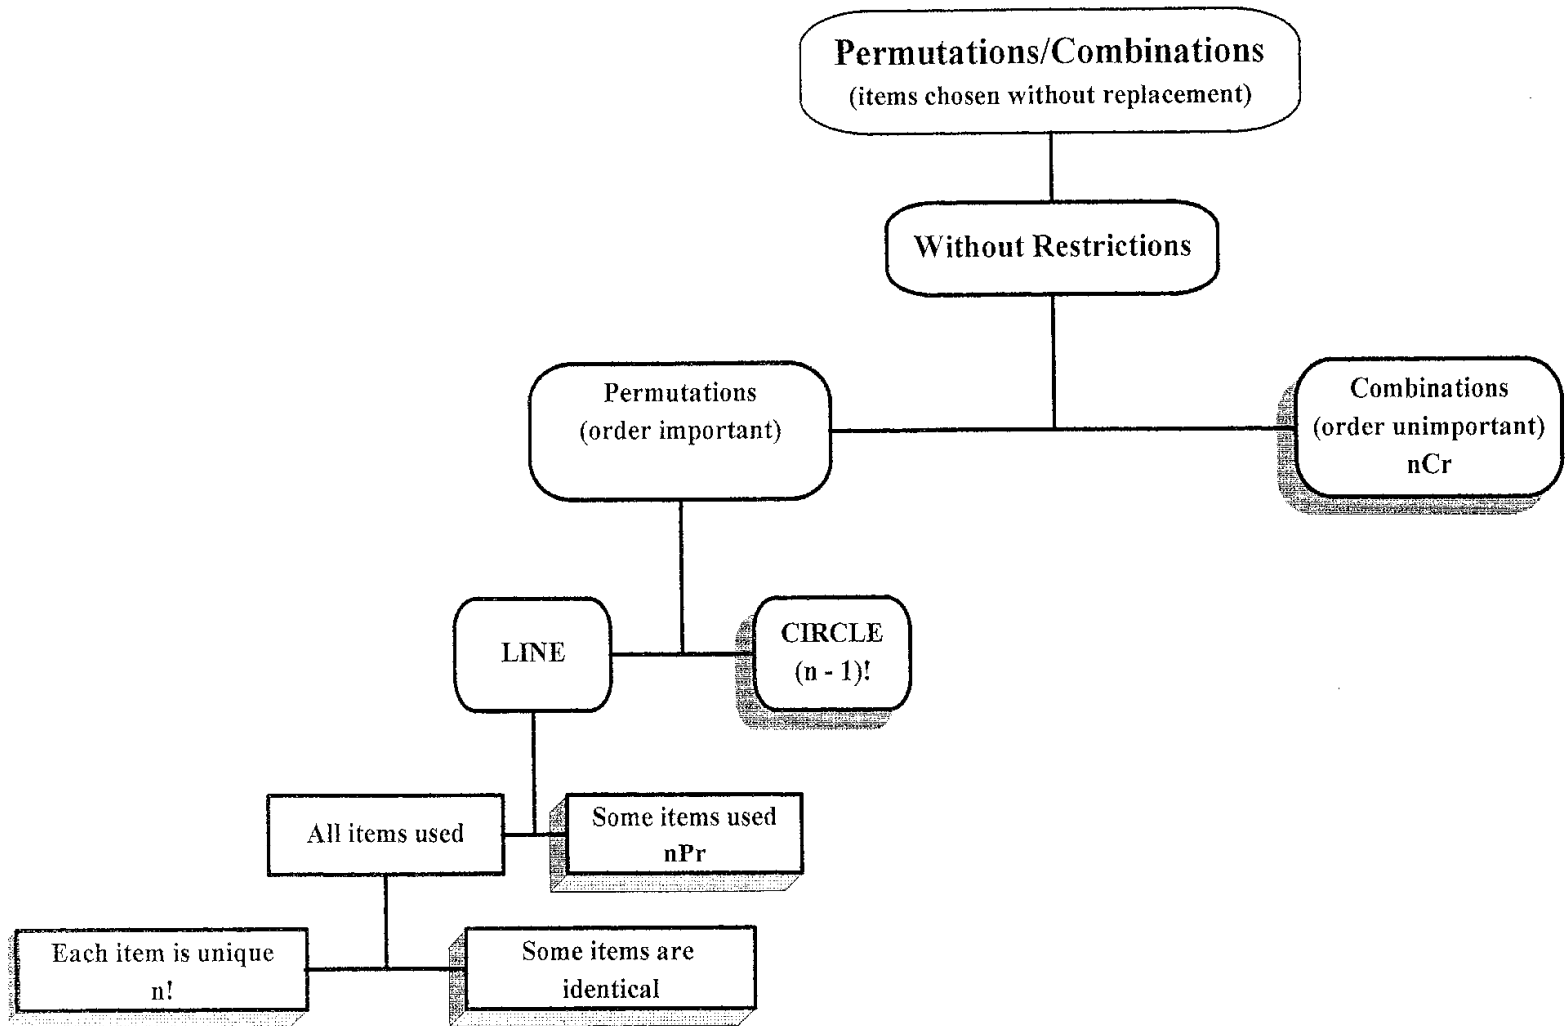

the number of ways  
Kevin & Jill are together

number of ways of arranging  
6 objects in a circle  
(Kevin & Jill) + 5 others

$$\begin{aligned}\text{Arrangements} &= 2! \times 5! \\ &= 240\end{aligned}$$

$$\begin{aligned}\text{Arrangements} &= 720 - 240 \\ &= \underline{480}\end{aligned}$$

## 1995 Extension 1 HSC Q3a)

A security lock has 8 buttons labelled as shown. Each person using the lock is given a 3 letter code.

(i) How many different codes are possible if letters can be repeated and their order is important?

$$\begin{aligned}\text{Codes} &= 8 \times 8 \times 8 \\ &= \underline{512}\end{aligned}$$

With replacement  
Use Basic Counting Principle

(ii) How many different codes are possible if letters cannot be repeated and their order is important?

$$\begin{aligned}\text{Codes} &= {}^8P_3 \\ &= \underline{336}\end{aligned}$$

Without replacement  
Order is important  
Permutation

(iii) Now suppose that the lock operates by holding 3 buttons down together, so that the order is NOT important.  
How many different codes are possible?

$$\begin{aligned}\text{Codes} &= {}^8C_3 \\ &= \underline{56}\end{aligned}$$

Without replacement  
Order is not important  
Combination

**Exercise 10I; odds**
