$\therefore \frac{y^2+b^2}{x^2-a^2} = -1 \quad \Rightarrow \quad y^2 + b^2 = a^2 - x^2$
$\Rightarrow \quad x^2 + y^2 = a^2 - b^2$

Hence the locus of T is a circle with radius $a^2 - b^2$ and centre O.

(iii) The focus of the ellipse is (ae, 0)

OT $= a^2 - b^2$ (radius)

$e = \frac{\sqrt{b^2 - a^2}}{a} \quad \Rightarrow ae = \sqrt{b^2 - a^2}$

$\therefore \quad OT = OS$

Hence OTS is an isosceles triangle. (2 equal sides).

$OR \perp RP$ and $OQ \perp PQ$ (tangent from an external point is perpendicular to radius at point of contact) **(1)** $\therefore \angle ORP + \angle OQP = 180^\circ$ Hence ORPQ is cyclic quad. (Opposite angles are supplementary) X is the midpoint of TS, hence OX $\perp$ TS (radius is the perpendicular bisector of the chord TS) $\therefore \angle OXP = 90^\circ$ $\angle ORP = 90^\circ$ from (1)	1	
$\therefore \angle OXP = \angle ORP$ (angles at the circumference subtend the same arc OP) Hence OXRP is cyclic quad. (ii) $\angle ROP = \angle RXP = \theta$ (angles at the circumference subtend the same arc PR in quad. OXRP) (2)	1	
$\angle TXV = \angle RXP = \theta$ (vertically opposite angles) RP = PQ (tangents to the circle from an external point)	1	
$\angle ROP = \angle QOP = \theta$ (angles at circumference subtend equal arcs RP and PQ), from (2) $\therefore \angle ROP + \angle QOP = 2\theta$ $\angle RVQ = \theta$ (angle at the circumference is half the angle at the centre subtend the same arc RQ)	1
