

# *Polynomial Results*

1. If  $P(x)$  has  $k$  distinct real zeros,  $a_1, a_2, a_3, \dots, a_k$ , then;  
 $(x - a_1)(x - a_2)(x - a_3) \dots (x - a_k)$  is a factor of  $P(x)$ .

e.g. Show that 1 and  $-2$  are zeros of  $P(x) = x^4 + x^3 + 3x^2 + 5x - 10$  and hence factorise  $P(x)$ .

$$\begin{aligned} P(1) &= (1)^4 + (1)^3 + 3(1)^2 + 5(1) - 10 \\ &= 0 \end{aligned}$$

$$P(-2) = (-2)^4 + (-2)^3 + 3(-2)^2 + 5(-2) - 10$$

$$= 0 \quad \therefore 1, -2 \text{ are zeros of } P(x) \text{ and } (x-1)(x+2) \text{ is a factor}$$

$$\begin{aligned} P(x) &= x^4 + x^3 + 3x^2 + 5x - 10 \\ &= (x^2 + x - 2)(x^2 + 5) \\ &= \underline{(x-1)(x+2)(x^2 + 5)} \end{aligned}$$

2. If  $P(x)$  has degree  $n$  and has  $n$  distinct real zeros,  $a_1, a_2, a_3, \dots, a_n$ , then  $P(x) = (x - a_1)(x - a_2)(x - a_3) \dots (x - a_n)$

3. A polynomial of degree  $n$  cannot have more than  $n$  distinct real zeros

e.g. The polynomial  $P(x)$  has a double zero at  $-7$  and a single zero at  $2$ .  
Write down;

a) a possible polynomial

$$P(x) = k(x - 2)(x + 7)^2 Q(x)$$

where -  $Q(x)$  is a polynomial and does not have a zero at  $2$  or  $-7$   
-  $k$  is a real number

b) a monic polynomial of degree 3.

$$P(x) = (x - 2)(x + 7)^2$$

c) A monic polynomial of degree 4

$$\underline{P(x) = (x-2)(x+7)^2(x-a)}$$

where  $a \neq 2$  or  $-7$

d) a polynomial of degree 5.

$$P(x) = k(x-2)(x+7)^2Q(x)$$

where -  $Q(x)$  is a polynomial of degree 2,  
and does not have a zero at 2 or  $-7$

-  $k$  is a real number

4. If  $P(x)$  has degree  $n$  and has **more** than  $n$  real zeros, then  $P(x)$  is the zero polynomial. i.e.  $P(x) = 0$  for all values of  $x$

5. If  $P(x) \equiv Q(x)$  (i.e. the two polynomials are identically equal), then the coefficients of each corresponding term **must** be equal.

i.e. if ;

$$a_1x^n + b_1x^{n-1} + c_1x^{n-2} + \dots + d_1x + e_1 \equiv a_2x^n + b_2x^{n-1} + c_2x^{n-2} + \dots + d_2x + e_2$$

$$a_1 = a_2$$

$$b_1 = b_2$$

$$c_1 = c_2$$

$$\vdots$$

$$d_1 = d_2$$

$$e_1 = e_2$$
