

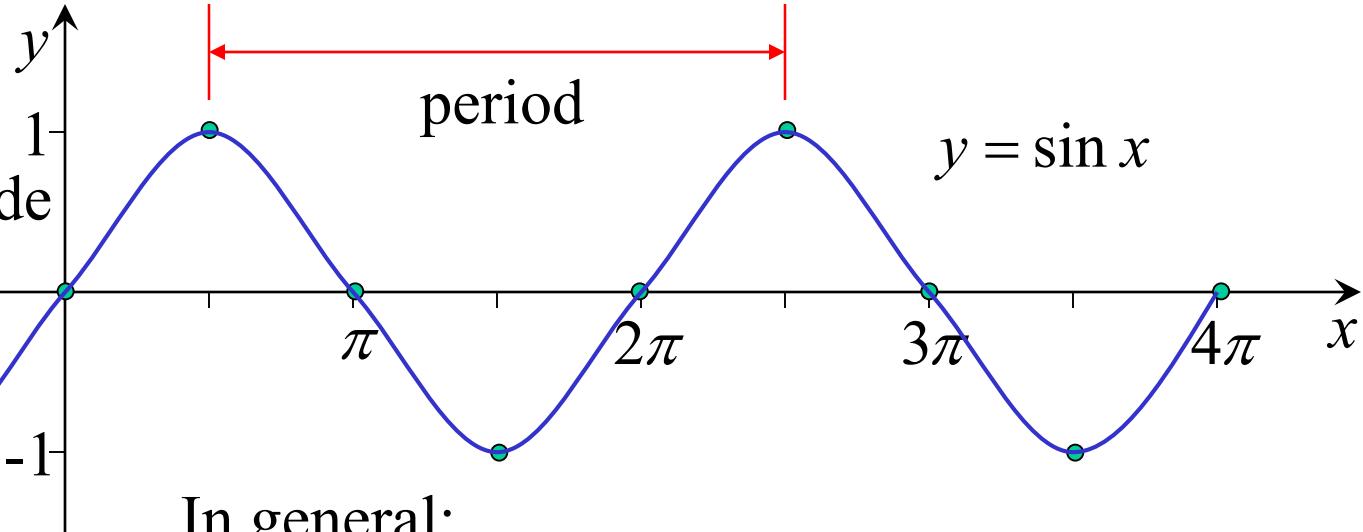

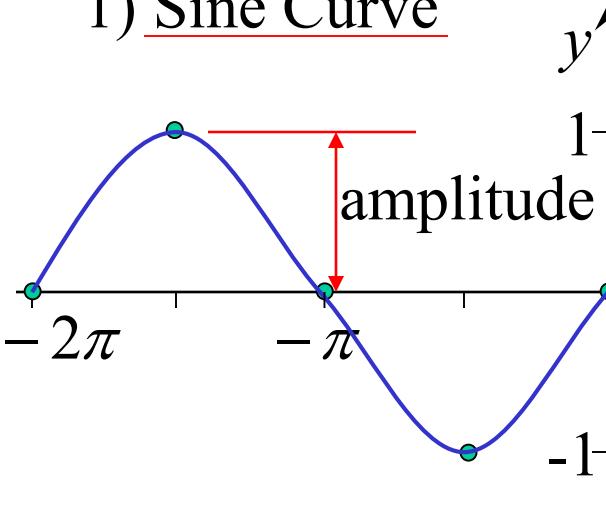

Graphing Trig

Functions

1) Sine Curve

In general;

domain : all real x

range : $-1 \leq y \leq 1$

odd function

$\sin(-x) = -\sin x$

$$y = a \sin(bx - c)$$

$$\text{period} = \frac{2\pi}{b} \text{ units}$$

$$\text{amplitude} = a \text{ units}$$

$$\text{divisions} = \frac{\text{period}}{4}$$

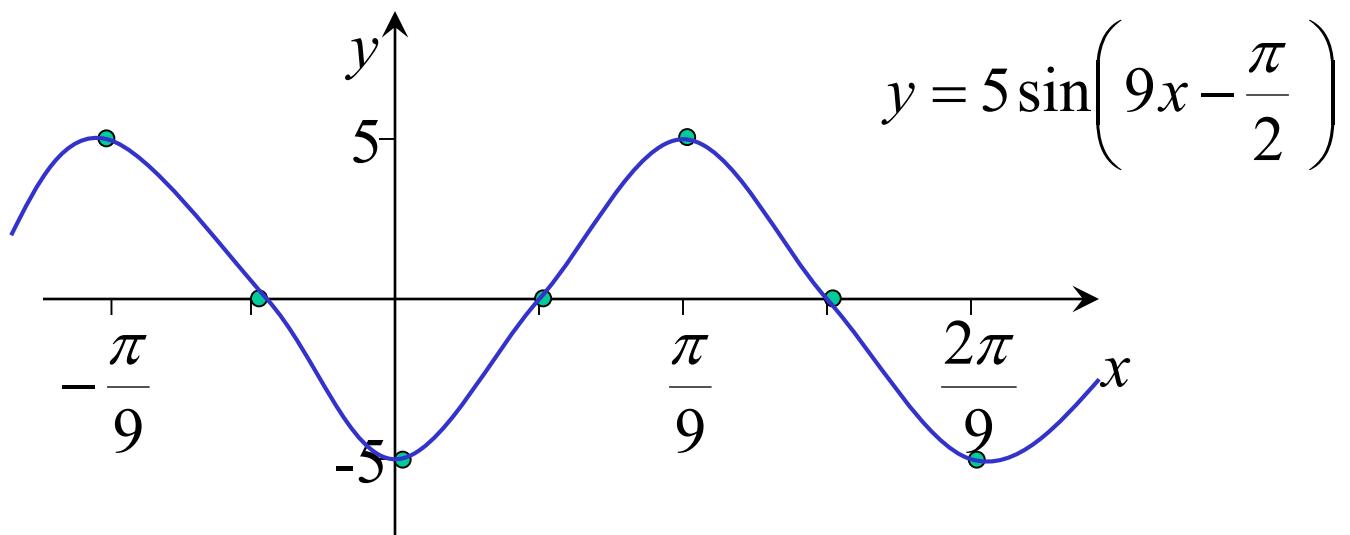

$$\text{phase} = \frac{c}{b}$$

$$\text{e.g. } y = 5 \sin\left(9x - \frac{\pi}{2}\right)$$

$$\text{period} = \frac{2\pi}{9} \text{ units}$$

$$\text{amplitude} = 5 \text{ units}$$

$$\begin{aligned}\text{divisions} &= \frac{\pi}{18} \\ \text{shift} &= \frac{\pi}{18} \text{ to right}\end{aligned}$$

2) Cosine Curve

even function

$$\cos(-x) = \cos x$$

$$y = a \cos(bx - c)$$

$$\text{period} = \frac{2\pi}{b} \text{ units}$$

$$\text{amplitude} = a \text{ units}$$

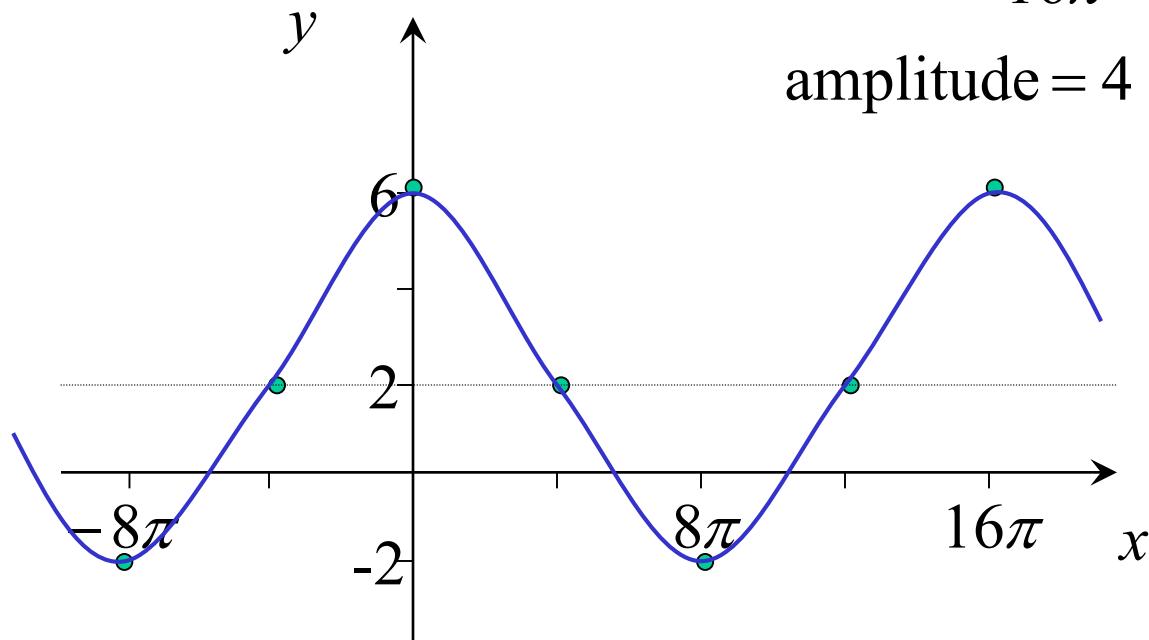

$$\text{divisions} = \frac{\text{period}}{4}$$

$$\text{phase} = \frac{c}{b}$$

e.g. $y = -4 \cos\left(\frac{x}{8} + \pi\right) + 2$ period = $\frac{2\pi}{\frac{1}{8}} = 16\pi$ divisions = 4π

shift = 8π to left, 2 up, upside down

amplitude = 4

$$y = -4 \cos\left(\frac{x}{8} + \pi\right) + 2$$

3) Tangent Curve

odd function

$$\tan(-x) = -\tan x$$

$$y = a \tan(bx - c)$$

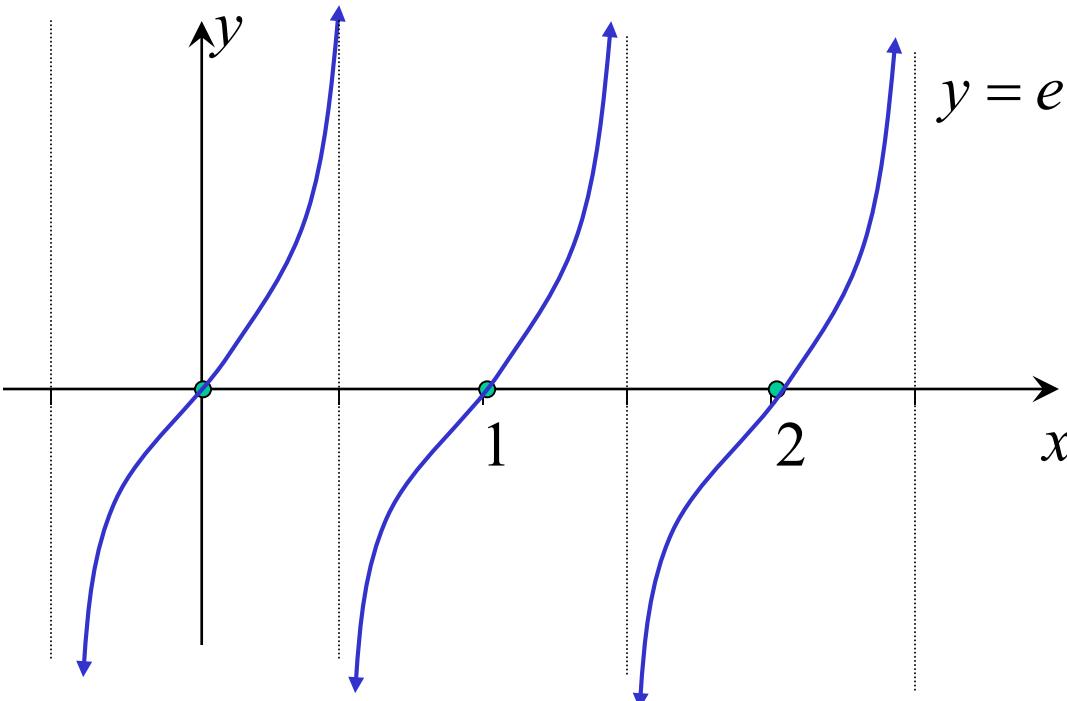

$$\text{period} = \frac{\pi}{b} \text{ units}$$

$$\begin{aligned}\text{divisions} &= \frac{\text{period}}{2} \\ \text{phase} &= \frac{c}{b}\end{aligned}$$

e.g. $y = e \tan(\pi x - 2\pi)$

$$\begin{aligned}\text{period} &= \frac{\pi}{\pi} \\ &= 1\end{aligned}$$

$$\begin{aligned}\text{divisions} &= \frac{1}{2} \\ \text{shift} &= 2 \text{ to right}\end{aligned}$$

$$y = e \tan(\pi x - 2\pi)$$
